

## ➤ METAL RE-ROOF

- Great R-value in limited spaces
- Reflects the heat and keeps the building cooler
- Prevents water infiltration

The easiest and most efficient way to insulate over an existing roof

Product recommended:  
AYR-FOIL™ A2V

### INSTALLATION METHOD:

- 1 Pre-cut measured length of **AYR-FOIL™** to span eave-to-eave, up and over the ridgeline.
- 2 Starting at one eave lay **AYR-FOIL™** flat onto roof towards the ridge and continue down to the next side.
- 3 Lay the next **AYR-FOIL™** course parallel to the first. If using tab products, ensure the square edge faces the tab edge of the previous course of **AYR-FOIL™**.
- 4 Seal the joints and make sure the entire roof line is covered with **AYR-FOIL™**.
- 5 Attach furring material of choice over the **AYR-FOIL™** covered roof.
- 6 Install metal roofing over furring strips.

### BE CAREFUL:

For proper ventilation, do not cover any vents (ridge, cable, soffit, etc) with insulation.
